SOURCE APPRAISAL

Annotated Bibliography

AI human-rights alignment research: a source-by-source guide to the 27 links cited in the Gemini report.

> **Bottom line.** The bibliography contains a strong empirical core, but it mixes that scholarship with first-party corporate materials, explainers, commentary, duplicate versions, and navigation pages. Formal use should consolidate or replace six entries.

PREPARED FOR

Review of “The Universal Declaration of Human Rights as a Blueprint for AI Alignment”

SOURCE CHECK

11 October 2026

SCOPE

27 cited links · relevance, contribution, limitations, and recommended use

CITATION NOTE

Original numbering preserved to support cross-reference with the report

The evidence base is useful, but unevenly curated

The report is best supported by primary empirical studies on human-rights parity, cultural variation, multilingual rights limitation, legal explainability, and international humanitarian law. Anthropic's documents establish what its systems are intended to do, not whether those systems reliably succeed.

Start with these

- **Normative foundation:** #1
- **Alignment practice:** #6, #11, #16
- **Human-rights evaluations:** #3, #4, #5, #24
- **Legal operationalization:** #22, #25
- **Governance and dual use:** #2, #15, #26

Do not double-count these

- #17 duplicates an earlier version of #3.
- #18 is a venue version of #4.
- #21 summarizes #5.
- #19 and #23 are profile or listing pages.
- #20 is a proceedings container, not an article.

Use with source-aware caution

Sources #11 and #16 are first-party descriptions. Sources #8, #9, #12, and #13 are explainers. Sources #10, #15, and #27 are commentary. They add context, but should not substitute for independent empirical evidence.

Two access limitations

The text of #10 and #27 was not accessible to the verifier. Their annotations therefore identify only their apparent role in the report and recommend manual confirmation before detailed attribution.

How to read the priority labels

Label	Meaning	Best use
Essential	Central to a major claim or method.	Read and cite directly.
High	Substantive corroboration or critique.	Use alongside core sources.
Supporting	Reliable orientation or teaching value.	Explain concepts; follow citations.
Context only	Commentary or commercial synthesis.	Frame debate, not proof.
Replace / Consolidate	Duplicate, container, aggregator, or profile.	Cite the underlying article.

Source annotations

1

Prabhakaran, V., Mitchell, M., Gebru, T., & Gabriel, I. (2022). A Human Rights-Based Approach to Responsible AI. arXiv:2210.02667.

PRIMARY RESEARCH / NORMATIVE FRAMEWORK **ESSENTIAL**

Establishes universal human rights as a cross-cultural vocabulary for responsible AI, while distinguishing rights as moral claims, legal instruments, and social practice. It is the report's clearest foundation for moving beyond vague fairness language toward accountable, human-centered analysis. Use it to frame the argument, but retain its own caution that the Universal Declaration of Human Rights is a starting point rather than a complete solution.

2

Chalkidis, I. (2025; updated 2026). Decoding Alignment: A Critical Survey of LLM Development Initiatives through Value-setting and Data-centric Lens. arXiv:2508.16982.

RESEARCH SURVEY / WORKING PAPER **ESSENTIAL**

Audits public documentation for six proprietary and open-weight model initiatives. Its value lies in shifting attention from optimization algorithms to who selects alignment objectives, how preference data are curated, and what remains undisclosed. It strongly supports the report's governance critique. Because it is a working paper and depends on corporate disclosures, conclusions should be treated as a documented survey of public evidence, not a complete audit of internal practice.

Open source →

3

Javed, R., et al. (2026). Hedging and Non-Affirmation: Quantifying LLM Alignment on Questions of Human Rights. ACM FAccT 2026 / arXiv:2502.19463.

PEER-REVIEWED EMPIRICAL STUDY **ESSENTIAL**

Introduces open-ended measures of hedging and non-affirmation across 4,738 prompts and 205 national or stateless identities. It directly supports the report's demographic-parity argument and identifies identity as a stronger predictor than conflict, sovereignty, or gross domestic product. The benchmark is unusually relevant because it evaluates unconstrained text, though its use of automated raters and prompt templates still requires sensitivity analysis and human validation.

Source annotations

4 **Zhou, K., Constantinides, M., & Quercia, D. (2025). Should LLMs be WEIRD? Exploring WEIRDness and Human Rights in Large Language Models. arXiv:2508.19269.**

PRIMARY EMPIRICAL STUDY ESSENTIAL

Compares five models against World Values Survey responses and international or regional human-rights charters. It provides the central evidence for the report's cultural-pluralism paradox: less alignment with Western, educated, industrialized, rich, and democratic values can coincide with more rights-violating outputs. The study is valuable for framing trade-offs, but its model sample is small and survey-response similarity should not be equated with full cultural representation.

Open source →

5 **Samway, K., et al. (2026). When Do Language Models Endorse Limitations on Human Rights Principles? arXiv:2603.04217.**

PRIMARY MULTILINGUAL BENCHMARK ESSENTIAL

Evaluates eleven models on 1,152 synthetic scenarios spanning 24 rights and eight languages. It supports the report's claims about cross-lingual variability, different treatment of civil-political versus economic-social-cultural rights, and sensitivity to elicitation format. The paper is especially useful for audit design. Its scenarios are synthetic and translations are machine-generated, so language-specific findings—particularly for lower-resource languages—should be interpreted cautiously.

Open source →

6 **Padhi, I., Natesan Ramamurthy, K., Sattigeri, P., et al. (2024). Value Alignment from Unstructured Text. arXiv:2408.10392.**

PRIMARY METHODS PAPER HIGH

Presents an end-to-end pipeline that extracts values from unstructured documents, generates synthetic instruction and preference data, and fine-tunes models through supervised and preference optimization. It grounds the report's claim that legal or policy texts can become training inputs without manually curated constitutions. The experiments demonstrate feasibility on a limited model and use-case set; they do not establish that text-derived values are legally faithful or robust under deployment.

Source annotations

7

LLM for social good: A value-driven LLM framework to embed social good values. (2026). Data & Policy.

PEER-REVIEWED FRAMEWORK ARTICLE | HIGH

Proposes a diagnostic and intervention framework for measuring distance from a chosen value set and performing topic-weighted realignment. It broadens the report beyond the Universal Declaration of Human Rights by showing how explicit ethical or regulatory references can structure audits. The article is clear that output-layer alignment is only one part of a socio-technical system, which is an important corrective to any claim that model tuning alone resolves governance.

Open source →

8

Constitutional AI: Self-Improving Safety for LLMs. (2026). AI Security & Safety.

PRACTITIONER EXPLAINER | SUPPORTING

Offers an accessible description of critique-revision training, reinforcement learning from AI feedback, advantages over human-only feedback, and known limitations. It is useful for teaching and terminology, not for establishing original empirical findings. Prefer the underlying Anthropic paper or constitution when making factual claims about Claude, and use this source only to orient non-specialist readers.

Open source →

9

Constitutional AI: How Anthropic Trains Models Using Written Principles. (2026). TDWI.

TRADE PUBLICATION EXPLAINER | SUPPORTING

Summarizes how written principles replace or supplement implicit human-preference signals and why that makes alignment more legible. Its concise framing is useful for executive audiences. It is a secondary interpretation rather than independent research, so it should not carry claims about effectiveness, scale, or safety without a primary source.

Open source →

Source annotations

10 **Puglisi, B. An Open Letter to Anthropic: Your Constitution Deserves a Governance Companion. Medium.**

PERSONAL COMMENTARY | CONTEXT ONLY

Advances the governance argument that a values document needs institutions for revision, contestation, and accountability. The perspective is relevant to the report's distinction between values and governance, but it is commentary rather than scholarly evidence. The page could not be text-verified during this review, so cite it only as an opinion source and avoid attributing detailed claims without checking the original directly.

Open source →

11 **Anthropic. (Updated 2026). Claude's constitution.**

FIRST-PARTY CORPORATE DOCUMENT | ESSENTIAL

Provides the primary record of how Anthropic describes Constitutional AI, the sources of its principles, and the role of critique and AI-generated feedback. It is indispensable for documenting what the company says it intends. Because it is authored by the system developer, it cannot independently validate performance or governance quality; pair it with external audits and empirical benchmarks.

Open source →

12 **Learning from feedback. AI Safety Atlas.**

EDUCATIONAL REFERENCE | SUPPORTING

Explains reward modeling, reinforcement learning from human feedback, and reinforcement learning from AI feedback within a broader account of specification gaming. It is helpful for building conceptual background and comparing training pipelines. As an educational synthesis, it should direct readers to the cited research rather than serve as the endpoint for contested empirical claims.

Open source →

Source annotations

13 **The Evolution of AI Alignment: A Comprehensive Analysis of RLHF and Constitutional AI. Uplatz.**

COMMERCIAL BLOG | CONTEXT ONLY

Provides a leadership-oriented comparison of human-feedback and constitutional approaches, emphasizing cost, scalability, and hybrid methods. The overview can help translate technical debates into strategic language. Its commercial-blog format and broad assertions make it unsuitable as core evidence; use primary papers for quantitative or causal claims.

Open source →

14 **AI Governance and Accountability: An Analysis of Anthropic's Claude. (2024). arXiv:2407.01557; alphaXiv rendering.**

INDEPENDENT GOVERNANCE ANALYSIS | HIGH

Applies the NIST AI Risk Management Framework and European Union AI Act to Claude, emphasizing transparency, benchmarking, privacy, and accountability gaps. It complements Anthropic's self-description with an external governance lens. The cited URL is an alphaXiv rendering rather than the canonical arXiv record, and the work originated in a university course context; verify the underlying manuscript before relying on precise metrics.

Open source →

15 **Wimmer, D., Ferentinos, L., Freeman, G., & Nakano, S. (2026). Claude's AI Constitution Series: When Constitutional AI Outpaces the Technology. Integrity Institute.**

CIVIL-SOCIETY COMMENTARY | HIGH

Critiques anthropomorphic language, undefined ethical terms, and accountability gaps in Claude's constitution. It is useful for testing the report's assumption that a constitution straightforwardly improves governance. This is an advocacy analysis, not a controlled empirical study; treat its claims as a structured critique and corroborate factual assertions with primary sources.

Open source →

Source annotations

16 **Anthropic & Collective Intelligence Project. Collective Constitutional AI: Aligning a Language Model with Public Input.**

FIRST-PARTY EXPERIMENT REPORT ESSENTIAL

Documents a public-input process involving about 1,000 U.S. participants, the conversion of public statements into trainable principles, and comparisons between public and company-authored constitutions. It is the report's main evidence for democratic participation in constitution design and candidly records subjective engineering choices. Limits include U.S.-only sampling, a company-led process, smaller experimental models, and first-party evaluation.

Open source →

17 **Do LLMs exhibit demographic parity in responses to queries about human rights? arXiv:2502.19463v1.**

EARLIER VERSION / DUPLICATE REPLACE

This is an earlier version of the Javed et al. study already cited as source 3. It adds no independent evidence and risks double-counting the same research. Consolidate both entries under the latest version and record the version date only if the analysis depends on changes between manuscripts.

Open source →

18 **Zhou, K., Constantinides, M., & Quercia, D. Should LLMs Be WEIRD? AIES/AAAI publication version.**

PUBLISHED-VERSION DUPLICATE CONSOLIDATE

Appears to be the venue-published form of source 4. Prefer this record for final citation when it is the authoritative version, while retaining the arXiv link for accessibility if desired. Do not treat the two URLs as separate studies.

Open source →

Source annotations

19 **Publications. Language and Information Technologies, University of Michigan.**

PUBLICATION-LIST PAGE REPLACE

A laboratory publication index may help locate a paper but does not itself substantiate any claim. Replace this entry with the specific article, authors, venue, and stable article URL that the report intended to cite. Until that match is made, the evidentiary contribution is indeterminate.

Open source →

20 **Findings of the Association for Computational Linguistics: EACL 2026. Proceedings volume.**

PROCEEDINGS CONTAINER REPLACE

Confirms the EACL 2026 Findings venue and publication context but points to the entire proceedings rather than a specific paper. A proceedings cover or table of contents is not an adequate citation for a substantive claim. Replace it with the article-level ACL Anthology record and page range.

Open source →

21 **When Do Language Models Endorse Limitations on Human Rights Principles? OpenTrain AI.**

PAPER AGGREGATOR REPLACE

A discovery-page summary of source 5. It may aid browsing, but it is neither the original manuscript nor a distinct analysis. Cite the arXiv paper and, if available, the peer-reviewed venue instead.

Open source →

Source annotations

22 **Chen, H., & Tanaka-Ishii, K. (2026). Executable explanation traces for legal LLM predictions via retrieval-augmented codification.**

PEER-REVIEWED OPEN-ACCESS STUDY ESSENTIAL

Evaluates executable, source-supported traces across five legal benchmarks, including European human-rights cases. It substantiates the report's discussion of retrieval-augmented codification and clarifies when explicit rule-like conditions improve auditability. The authors also identify limits where outcomes depend on procedure, evidence, or discretion absent from the record—an important warning against equating benchmark accuracy with legal understanding.

Open source →

23 **Hershcovich, D. Home page / publications.**

RESEARCHER PROFILE REPLACE

A researcher homepage is useful for identifying publications but is not a citable source for the report's claims. Replace it with the exact paper or dataset attributed to the researcher. If no specific work can be identified, remove the entry.

Open source →

24 **Mavi, J., Găitan, D. T., & Coronado, S. (2025). From Rogue to Safe AI: The Role of Explicit Refusals in Aligning LLMs with International Humanitarian Law. arXiv:2506.06391.**

PRIMARY BENCHMARK PREPRINT HIGH

Evaluates eight models on prompts derived from international humanitarian law and examines both refusal frequency and explanatory quality. It supports the report's discussion of legal-compliance gaps and lightweight system-prompt interventions. The study measures refusal behavior rather than real-world legal compliance, and its preprint status, curated prompt set, and model-version sensitivity should temper comparative rankings.

Open source →

Source annotations

25

Law-Following AI: Designing AI Agents to Obey Human Laws. Institute for Law & AI.

LEGAL-POLICY SCHOLARSHIP **ESSENTIAL**

Argues that high-stakes AI agents should be designed to refuse illegal actions and may be treated as duty-bearing legal actors without being legal persons. It is the report's strongest source for the law-following AI proposal. The piece is a normative and institutional argument, not evidence that current systems can reliably interpret or comply with open-textured law.

Open source →

26

Ball, S., & Hackemann, P. (2026). Position: The Alignment Community is Unintentionally Building a Censor's Toolkit. ICML 2026 / PMLR 306.

PEER-REVIEWED POSITION PAPER **ESSENTIAL**

Frames alignment techniques as dual-use infrastructure that can support safety or information control, then argues for model pluralism, auditing, and public awareness. It directly grounds the report's censorship dilemma. As a position paper, it synthesizes evidence and advances an argument rather than experimentally estimating the prevalence or magnitude of censorship risk.

Open source →

27

Who Writes the AI Constitution? Lawfare.

LEGAL COMMENTARY **CONTEXT ONLY**

Addresses the institutional legitimacy of selecting and revising AI principles, making it relevant to the report's governance section. The page was not text-accessible during this review, so the annotation is limited to its apparent subject and source type. Retain it as commentary only after manually confirming the author, publication date, and precise argument.

Open source →

Five edits would make the source base publication-ready

1 Consolidate alternate versions

Merge #17 into #3 and #18 into #4. Cite the latest authoritative version, then add the accessible manuscript link only as a secondary access route.

2 Replace navigation pages with article-level records

Identify the intended works behind #19, #20, and #23. Add authors, exact title, venue, year, pages or article number, and a stable article URL.

3 Remove aggregator duplication

Replace #21 with #5. An aggregator may aid discovery, but it should not appear as an independent source when the original manuscript is available.

4 Separate evidence from interpretation

Group peer-reviewed studies and research manuscripts separately from corporate documentation, educational explainers, trade articles, and commentary. This prevents source type from being mistaken for evidentiary strength.

5 Qualify claims that outrun the studies

A benchmark shows behavior under a defined prompt set and model version; it does not prove deep conceptual understanding, legal compliance, or worldwide deployment behavior. Replace absolute language with scope-matched conclusions.

> **Recommended minimum reading set:** #1, #2, #3, #4, #5, #6, #11, #16, #22, #24, #25, and #26. Together they cover the report's normative foundation, training methods, empirical audits, legal applications, governance, and dual-use risk.

This bibliography evaluates the sources cited in the supplied report; it does not independently reproduce every experiment or adjudicate the underlying legal questions.
